3: pir3:\*
4: pir4:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: Perfect score: Sequence:

1 CKKKKKKKKKKKKKKKKKKK 21

BLOSUM62

Scoring table:

Gapop 10.0 , Gapext 0.5

105224 segs, 38719550 residues

Total number of hits satisfying chosen parameters: 105224

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0%

Maximum Match 100% Listing first 45 summaries

Database :

SwissProt\_40:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Nature 409:685-690(2001).

-I-FUNCTION: Transcriptional repressor. Binds to the consensus DNA sequence: 5'.GA[GT]AN(GG][AG][CC-3', Might protect cells from apoptosis. Might be involved in pre-mRNA splicing (By similarity).

-I-SUBCELLULAR LOCATION: Nuclear (By similarity).

-I-ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.

-I-TISSUE SPECIFICITY: Widely expressed.

Submitted (NOV-1994) to the EMBL/GenBank/DDBJ databases.
-i- FUNCTION: BINDS IN VITRO TO CENTROMERES AND MICROTUBULES. IT IS A
CENTROMERE DNA-CBF3-BINDING FACTOR AND IS INVOLVED IN MITOTIC
CHOMOSOME SDGREGATION. IT IS ESSENTIAL FOR CELL GROWTH. MAY BE IN
SOME WAY ASSOCIATED WITH THE CBF3 110 kDa SUBUNIT (CBF3A).
-i- SUBCELLULAR LOCATION: NUCLEAR: NUCLEOLAR.
-i- SUBCELLULAR LOCATION: NUCLEAR: NUCLEOLAR.

-i- DISEASE: DEFECTS IN TCOF1 ARE THE CAUSE OF TREACHER COLLINS SYNDROME (TCS). TCS IS A AUTOSOMAL DOMINANT DISORDER OF CRANIOFACIAL DEVELOPMENT THAT OCCURS WITH AN INCIDENCE OF 1/50,000 LIVE BIRTHS. THE CLINICAL FEATURES OF TCS ARE BILATERALLY SYMMETRICAL AND INCLUDE: (1) ABNORMALITIES OF THE EXTERNAL EARS, ATRESIA OF THE EXTERNAL EAR CANALS, AND MALFORMATION OF THE MIDDLE EAR OSSICLES, WHICH MAY RESULT IN CONDUCTIVE HEARING LOSS; (2) LATERAL DOMINARD SLOPING OF PALPEBRAL FISSURES, FREQUENTLY WITH COLOBOMAS OF THE LOWER EYELIDS; (3) HYPOPLASIA OF THE MANDIBLE AND ZYGOMATIC COMPLEX; (4) CLEFT PALATE.
                                 VARIANT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. The protein antigen is modified by the covalent addition of a peptide sequence which facilitate entry of the antigen into antigen presenting cells (APCs). The present sequence is one such peptide sequence which can be used to modify the soluble antigens. The present sequence is peptide by. The modified antigen composition may be used for immunising against, or treating a tumour e.g. prostate and breast carcinoma or multiple myeloma, or pathogen in mammals.
This sequence represents one of two identical chains disulphide bonded to form a bombesin dimer. The invention relates to bivalent agonists, with affinity for at least 1 G-protein coupled receptor (GPCR). The
                                                                                                                      Claim 41;
                                                                                                                                                                    Bivalent agonist of G-protein coupled receptors containing two ligand domains - bonded to molecular backbone, for treatment on hypotension, promotion of skin tanning etc., also for delivering and gene therapy vectors to selected cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       on alpha melanocyte-stimulating hormone, MSH). The bivalent agonists are administered orally, by injection or topically. Typical doses for skin tanning are 1-4000 (especially 30-100) mu mole/kg systemically or the bivalent agonists are administered topically in a composition containing 0.001-10 (especially 1) mM. Where both LD are agonists, the bivalent agonist has a synergistically higher activity than two individual agonist ligands, and where at least 1 is an antagonist the effect is stimulatory. The bivalent agonists are active at lower concentrations than known agonists so should avoid toxicity problems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         bivalent agonists comprise: (a) two ligand domains (LD), individually agonists or antagonists for GPCR, spaced 40-250 Angstrom apart, and (b) a molecular backbone (MB) covalently bound to LD. The bivalent agonists are useful in human or veterinary medicine as carriers for drugs or gene

The present invention relates to the isolation of novel DNA-binding proteins, and cDNA (AAS29030-AAS29157) and genomic sequences encoding for these proteins. DNA-binding proteins such as histones, chromo (chromatin organisation modifier) domain proteins, and Y-box binding proteins may contribute to diseases resulting from aberrant DNA organisation and/or gene transcription. The sequences of the invention are useful in screening assays to identify antagonists and/or agonists that may enhance or block activities mediated by DNA-binding proteins. Blockers of DNA-binding proteins may be useful in treating disorders such as malignant diseases (e.g. cancer), autoimmune disorders (e.g. diabetes medilitus), rheumatic diseases (e.g. rheumatoid arthritis), genetic abnormalities (e.g. cystic fibrosis), infectious diseases (e.g. HIV) and neurological disorders (e.g. Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-NOV-2000

                                                       The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, hamunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                Tang

                                                                    The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                            The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immun disorders -
                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammanomodulatory activity and activiny insulation activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The present invention relates to the isolation of novel DNA-binding CC proteins, and cDNA (AAS29030-AAS29157) and genomic sequences encoding CC for these proteins. DNA-binding proteins such as histones, chromo CC (chromatin organisation modifier) domain proteins, and v-box binding proteins may contribute to diseases resulting from aberrant DNA CC organisation and/or gene transcription. The sequences of the invention CC are useful in screening assays to identify antagonists and/or agonists CC that may enhance or block activities mediated by DNA-binding proteins. CC Blockers of DNA-binding proteins may be useful in treating disorders cs such as malignant diseases (e.g. cancer), autoimmune disorders CC (e.g. diabetes mellitus), rheumatic diseases (e.g. rheumatoid CC arthritis), genetic abnormalities (e.g. cystic fibrosis), infectious CC diseases (e.g. HIV) and neurological disorders (e.g. Alzheimer's CC used in gene therapy. AAU18134-AAU18281 represent novel DNA-binding CC used in gene therapy. AAU18134-AAU18281 represent novel DNA-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, system disorders, muscular disorders, renal disorders, infectious diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54077 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer associated nucleic acid molecules (N) and proceins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders in a patient's genome that affect the activity of P by expressing in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer associated P, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 are seen t invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  vaccine; peptide therapy; stem cell growth factor; haematopoiesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human polynucleotides (AA179941-AA193841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, haematopoiesis activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation cancer.
